

## Conditions

- (A) Electrical storage appliances for heating the building or electrical storage appliances for heating the utility water must be properly installed in the withdrawal site.
- (B) The consumer will ensure the technical blocking of the electrical storage appliances during peak times (when high tariffs are valid).
- (C) Electrical storage appliances must be properly installed in the withdrawal site for heating the building.
- (D) The total installed input of the electrical storage appliances must be at least 55% of the total installed input in the withdrawal site for acknowledgement of the distribution rate. The distributor will grant the consumer this tariff even if the total input of the direct heating electric appliances amounts to less than 55 % of the value of the main circuit breaker installed in front of the electricity meter, provided that the consumer demonstrates that the electrical output of the direct heating electrical appliances corresponds to the thermal losses in the building being heated.
- (E) Hybrid (mixed) electrical appliances must be properly installed in the withdrawal site for heating the building.
- (F) The total installed input of the hybrid (mixed) electrical appliances, including the installed input of the storage appliances for the heating of utility water, must be at least 50 % of the total installed input in the withdrawal site for acknowledgement of the distribution rate. The distributor will grant the consumer this tariff even if the total input of the direct heating electric appliances amounts to less than 50 % of the value of the main circuit breaker installed in front of the electricity meter, provided that the consumer demonstrates that the electrical output of the direct heating electric appliances corresponds to the thermal losses in the building being heated.
- (G) The consumer will ensure the technical blocking of the storage parts during peak times (when high tariffs are valid).
- (H) Direct electrical heating appliances must be installed in the withdrawal site for heating the building.
- (I) The total installed input of the direct heating electrical appliances, including the installed input of the storage appliances for heating utility water, must be at least 40 % of the total installed input in the withdrawal site for acknowledgement of the distribution rate. The distributor will grant the consumer this tariff even if the total input of the direct heating electric appliances amounts to less than 40 % of the value of the main circuit breaker installed in front of the electricity meter, provided that the consumer demonstrates that the electrical output of the direct heating electric appliances corresponds to the thermal losses in the building being heated.
- (J) The consumer will ensure the technical blocking of the electrical heating appliances during peak times (when high tariffs are valid).
- (K) The consumer shall ensure technical blocking of the electric heating appliances during high-tariff hours.
- (L) The rate for heating with a thermal pump put into operation by 31 March 2005. Putting into operation refers to concluding the first contract on delivery, the distribution of electricity or a contract on affiliated services of an electricity delivery at this rate.
- (M) The rate is intended for withdrawal points where the consumer credibly demonstrates that for heating the building there is a system of heating with a thermal pump properly installed, the output of which corresponds to the thermal losses of the heated building.
- (N) The rate for heating with a thermal pump put into operation by 1 April 2005. Putting into operation refers to concluding the first contract on delivery, the distribution of electricity or a contract on affiliated services of an electricity delivery at this rate.
- (O) The tariff is intended for withdrawal points where the consumer credibly demonstrates to the distributor that the building in question is heated using a properly installed and used heating system with a heat pump.
- (P) The heat output of the heat pump covers at least 60 % of the thermal losses of the heated building.
- (Q) If the heating system with a heat pump is part of the communal premises of the building, serving only for common utilization by the owners or users of the apartments, it will be powered using an independent power supply and measured using independent measuring equipment.

All prices are given without VAT. The total prices and the prices including VAT serve only as a rough guide for the consumer; they were calculated using the prices shown above and subsequently rounded.

**Notes:** <sup>1)</sup> Products can be combined only with the distribution rates in the appropriate column • <sup>2)</sup> in accordance with the price decision of the ERA No. 10/2007 (for the distribution system operated by PŘEDistribuce, a.s.) • <sup>3)</sup> this involves the total price of the systemic services, the price for the support of electricity from renewable resources, the combined production of electricity and heat, the price of the billing activities of Operátor trhu s elektřinou, a.s., according to the price decision of the ERA No. 9/2007 and tax on electricity in accordance with Act 261/2007 Coll. This applies to every MWh consumed during both peak and off-peak times.
